懒汉模式:
   public class Demo{
       private static Demo instance;
       private Demo() {
       }
       public static Demo getInstance() {
            if (null == instance) {
                 instance = new Demo();
            }
           return instance;
       }
饿汉模式:
   public class Demo{
       private static Demo instance = new Demo();
       private Demo() {

```

public static Demo getInstance() {

return instance;
